Version 5.2
- If there are empty mentions in a sentence being navigated to, show a message to the user.

Version 5.1
- BugFix: When deleting a mention, its token was still marked as used even when it wasn't anymore.
- Adding ability to merge another annotation file into the currently open session.
- Changing the sentence name tag from "<name>: " to "<name>:" (removed extra space).

Version 5.0
- Added ability to mark tokens as irrelevant (colors them dark red)
- Input sentences file can have another field for a sentence name (marked by "<name>: " and placed on the line after the ID).
- Next and Previous buttons in sentence explorer loops around and has "long press" functionality.
- BugFix: "IsPronoun" checkbox was not anchored in the mention editor dialog.

4.2
- Adding option to mark a predicate as a pronoun (like an entity can). This adds a "isPronoun" field to proposition mentions in the output XML.
- Bug fix: couldn't open mention editor when something was marked as a pronoun.
- Cleaned up some warnings.

4.1
- Enable adding and removing tokens from a mention.

4.0
- Enable merging types together.
- Allow to corefer between explicit and implicit propositions.
- Automatically annotate implicit propositions. After one is created, the user is asked whether to perform the procedure.
- Enable removing an argument from an existing proposition mention.
- Enable adding an argument to an existing proposition mention.
- Added string search throughut the sentences. Double clicking a search results brings the sentence up.
- Bugfix: When loading an annotation file, implicit propositions were marked as explicit.
- Bugfix: Editing of argument description (questions) caused an error.
- Bugfix: Do not disallow marking an implicit proposition as an argument.
- Do not show implicit proposition mentions in the entailment dialog.

3.4
- Added contradiction edges to the entailment graph.
- Allow to mark entity mentions as pronouns. They are not shown in the entailment graphs.

3.3
- In the context menu of propositions, the argument questions are shown.
- Colors of arrows in entailment graphs slightly changed.
- A proposition should show all arguments used and not just the arguments used by the mention with the max number of arguments.
- BugFix: When opening args entailment window and no args exist, threw exception.
- BugFix: When trying to remove attribution in propoisition editor dialog, threw exception.
- If all argument slots are used, an additional one is placed (in the context menu).

3.2
- Attribution feature: can add an existing entity as an attributer to a proposition. It is seen on a proposition is red, and can be edited by double clicking the proposition.
- BugFix: Used tokens are marked correctly in sentences (in purple).

3.1
- Allow reading annotations from earlier than version 3.0 (converts relations to propositions). There is no longer a need to keep a 2.0 and 3.0 version.
- BugFix: If the entailment window was opened when there is nothing annotated yet, and then reopened once something was annotated, there was an exception thrown.

3.0
- No more Relation and Event separation. They are all called propositions. An implicit proposition predicate is possible. The creation behavior is like a previously named "event".
- IMPORTANT: This version currently does not support earlier versions of annotation. To view or edit older versions, use an earlier version of the tool (2.0 is best).
- Bugfix: Changed Arg index (+1) in argument question dialog and also in the mention editor dialog.
- Bugfix: Entailments form closed when pressing its help button.

2.0
- Added ability to create entailment graphs on the different types and arguments (for propositions).

1.2.1 Changes:
- Important bug fix: Crashed when opening an annotated file and there are types that are empty (ID of type is larger than the number of types).
- Aesthetics.

1.2 Changes:
- Added option to create an implicit Relation.
- Can create relations with the same predicate multiple times in the same sentence.
- Events are written out with the args embedded and in order, instead of as a list of ID-ordered

argument with the predicate in front.

1.1 Changes:
- Some color changes
- Bigger font sized
- Alert the user on zero args predicates
- Can delete mention on right click. The parent type still appears even when there are zero mentions for it. This needs to be addressed in next versions.
- added some vertical space between File / done / cancel and the annotation area.
- Consistency of arg numbers between combobox and viewers.
- Added scrolling in all mentions dialog
- Don't allow the user to input the same argument twice for the same event.
- Comment is no longer added when adding a mention. It can be written in the mention editor dialog.
- original question for argument appears automatically if a similar mention was annotated in the past.
- Different colors for helping message at the top when annotating a relation and an event.
- Better indication of a successful save
- Refresh Ctrl-R option.
